# **Energy Supply and Demand**

**Fund for Danish Consultancy Services  
Assessment of Least-cost, Sustainable Energy Resources  
Maldives**

Project INT/99/R11 – 02 MDV 1180

April 2003

Submitted by:

ENERGY NSULTING NETWORK

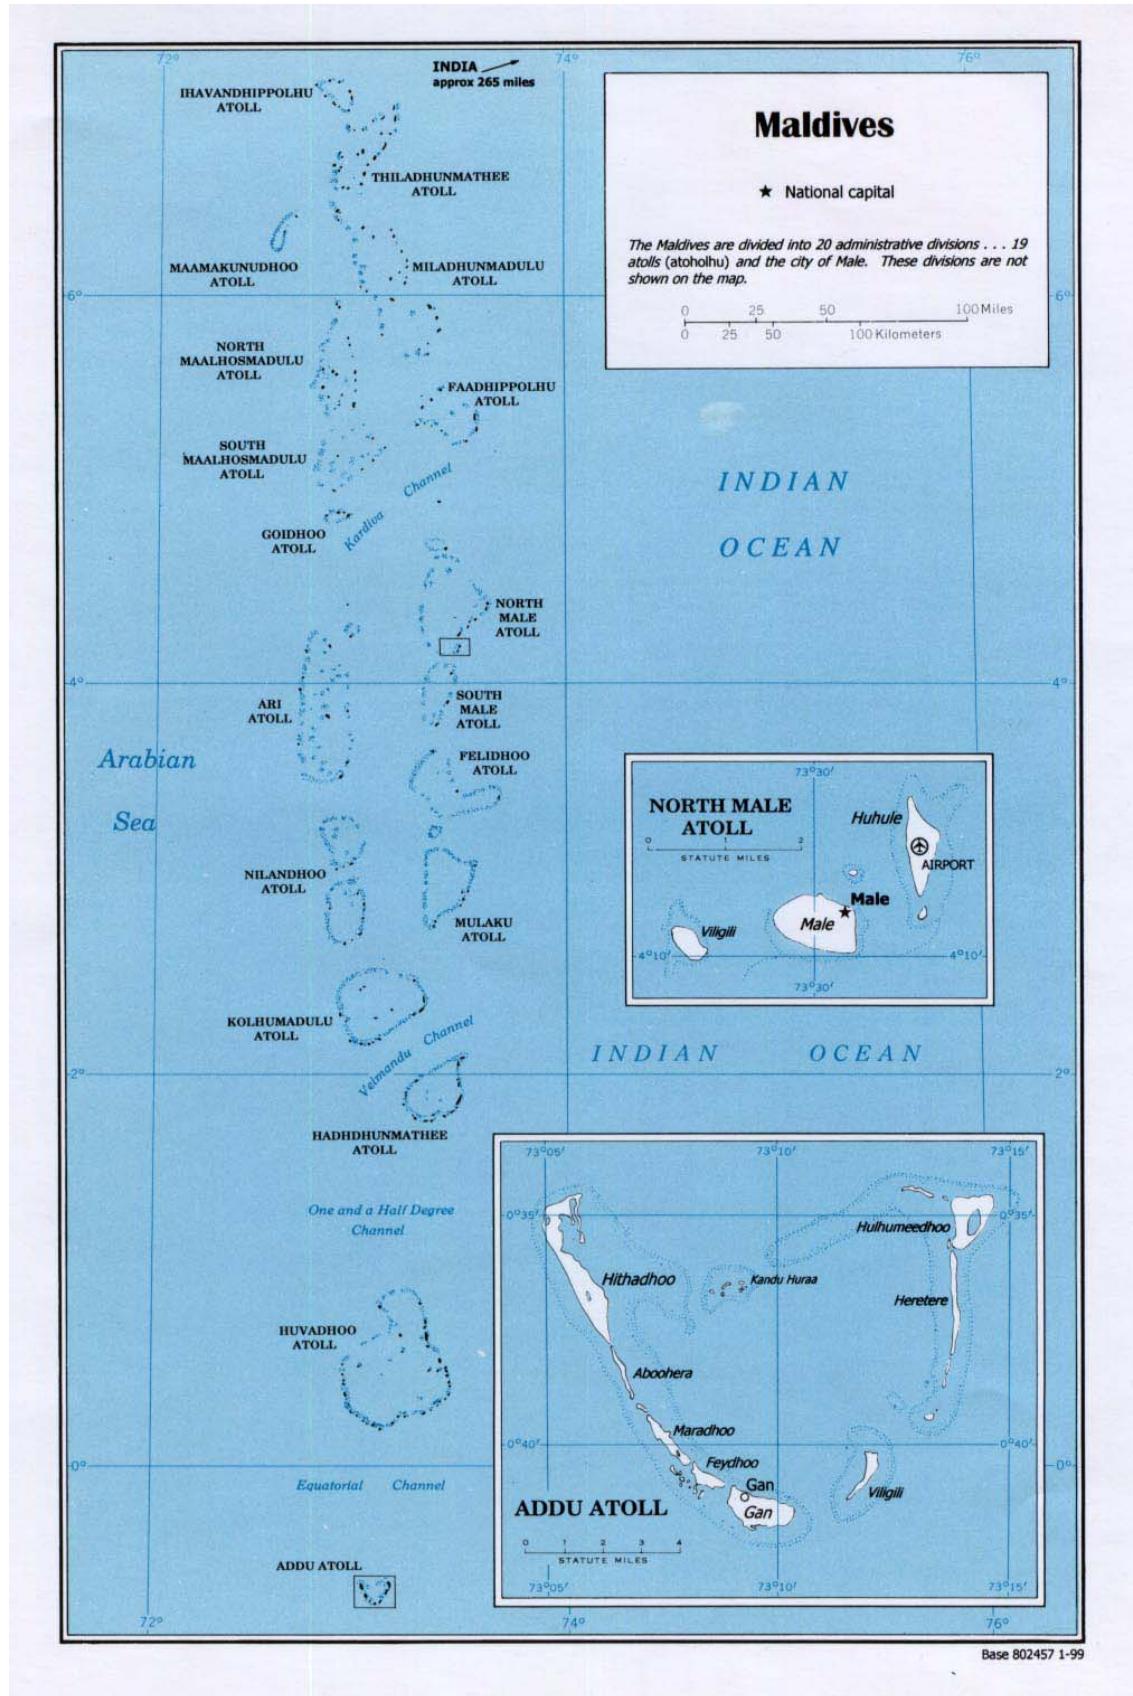

In co-operation with:

**GasCon**

## Map of Location

## List of Abbreviations

| Abbreviation | Full Meaning  |
|--------------|---|
| CDM          | Clean Development Mechanism   |
| CEN          | European Standardisation Body   |
| CHP          | Combined Heat and Power   |
| CO2          | Carbon Dioxide (one of the so-called “green house gases”)               |
| COP          | Conference of the Parties to the Framework Convention of Climate Change |
| DEA          | Danish Energy Authority   |
| DK           | Denmark   |
| ECN          | Energy Consulting Network   |
| elec         | Electricity   |
| EU           | European Union  |
| EUR          | Euro  |
| FCB          | Fluidised Bed Combustion  |
| GDP          | Gross Domestic Product  |
| GHG          | Green house gas (principally CO2)                                       |
| HFO          | Heavy Fuel Oil  |
| IPP          | Independent Power Producer  |
| JI           | Joint Implementation  |
| Mt           | Million ton   |
| Mtoe         | Million ton oil equivalents   |
| MCST         | Ministry of Communication, Science and Technology                       |
| MOAA         | Ministry of Atoll Administration  |
| MFT          | Ministry of Finance and Treasury  |
| MPND         | Ministry of National Planning and Development                           |
| NCM          | Nordic Council of Ministers   |
| NGO          | Non-governmental organization   |
| PIN          | Project Identification Note   |
| PPP          | Public Private Partnership  |
| PDD          | Project Development Document  |
| PSC          | Project Steering Committee  |
| QA           | Quality Assurance   |
| R&D          | Research and Development  |
| RES          | Renewable Energy Sources  |
| STO          | State Trade Organisation  |
| STELCO       | State Electric Company Ltd.   |
| ToR          | Terms of Reference  |
| UN           | United Nations  |
| UNFCCC       | United Nations Framework Convention on Climate Change                   |
| UNOPS        | United Nations Office for Projects Services                             |
| UNDP         | United Nation Development Programme                                     |
| VAT          | Value Added Tax   |

## Units

Given the variety and general in-consequence regarding the use of energy units when referring to energy resources and utilisation of resources found in the available literature, we have chosen to use the following units, which in relation to the physical units are based on the SI-system.

| Measure         | Unit                    | Conversion   |
|-----------------|-------------------------|--|
| Energy contents | Joule (J)               | 1 PJ = $10^{15}$ J = 0.278 TWh = 0.239 million Gcal<br>1 TWh = $10^9$ kWh = 0.860 million Gcal = 3.6 PJ<br>1 PJ = 23,900 tonnes oil equivalent (toe) |
| Capacity        | Watt (W)                |  |
| Temperature     | Celcius ( $^{\circ}$ C) |  |
| Currency        | Euro (EUR or €)         |  |

## Prefix

The following prefixes have been used to indicate powers of 10:

| <b>Number</b> | <b>Prefix</b> | <b>Abbreviation</b> |
|---------------|---------------|---------------------|
| $10^{15}$     | Peta          | P                   |
| $10^{12}$     | Tera          | T                   |
| $10^9$        | Giga          | G                   |
| $10^6$        | Mega          | M                   |
| $10^3$        | Kilo          | k                   |

## Energy carriers characteristics / Assumptions

| <b>Energy carrier</b> | <b>Density<br/>(ton/m<sup>3</sup>)</b> | <b>Heat value<br/>(GJ/ton)</b> | <b>Toe conversion factors<br/>(toe/ton)</b> |
|-----------------------|--|--------------------------------|---|
| Diesel oil / gas oil  | 0.84                                   | 42.7                           | 1.035                                       |
| Petrol/motor gasoline | 0.75                                   | 43.8                           | 1.070                                       |
| Jet petrol (JP 1)     | 0.80                                   | 43.5                           | 1.070                                       |
| Aviation gasoline     | 0.71                                   | 43.8                           | 1.070                                       |
| Kerosene              | 0.80                                   | 43.5                           | 1.045                                       |
| LPG                   | 0.54                                   | 46.0                           | 1.130                                       |

## 1 INTRODUCTION

This report is prepared for the Maldivian Ministry of Communication, Science and Technology (MCST) supported by United Nations Office for Projects Service (UNOPS), Nordic Funds, as part of the United Nations Development Programme (UNDP) for Maldives, in an effort to prepare an “Assessment of Least-cost, Sustainable Energy Resources”. The report is prepared by Energy Consulting Network, supported by Tech-Wise, Danish Technological Institute, and GasCon.

The project “Assessment of Least-cost, Sustainable Energy Resources” shall contribute to the efforts to exploit the renewable energy potential in the Maldives. The work in the project includes a solar, wind, landfill gas and biomass and biogas resource assessment, and well as an analysis of present situation and prospects and possibilities as regards production and use of renewable energy.

The result of the project will be used in the planning of future energy sector of the Maldives.

The project was started in May 2003, and will run until end 2004.

This report is prepared as a result of energy supply and demand survey, which was conducted in October 2003.

For and on behalf of Energy Consulting Network, we would like to take this opportunity to thank everyone who has provided assistance, information and ideas for the work process involved in producing this report.

Copenhagen 2004-05-04

## 2 WHY SUPPLY AND DEMAND ANALYSES?

The energy sector is a significant factor in relation to the national balance of trade and national economic budget. Furthermore, a steady and secure of supply of energy is a basic need for the development and operation of any nation.

Supply and demand analyses are essential in order to understand the characteristics of the national energy balance and the energy market dynamics.

By establishing realistic and operational supply and demand analyses a national energy balance can be developed. A reliable energy balance is the fundamental requirement for establishing reliable modelling of the potential energy market development, and the effects of any given market intervention.

So, in essence an energy balance is necessary to provide an understanding of the complexity of the energy sector and to assess the social, legal, technological, financial and economic effects of any measure of intervention into the energy sector.

Different types national energy modelling tools have been used for decades in Europe. The use of energy statistics and balances provides for development of powerful energy and national policy assessment tools, such as:

- Modelling and impact analyses in relation to strategy development, and action planning
- Benchmarking (regional, sectoral and technology comparison, international comparison)
- Development of policy indicators (energy intensity, price elasticity, etc)

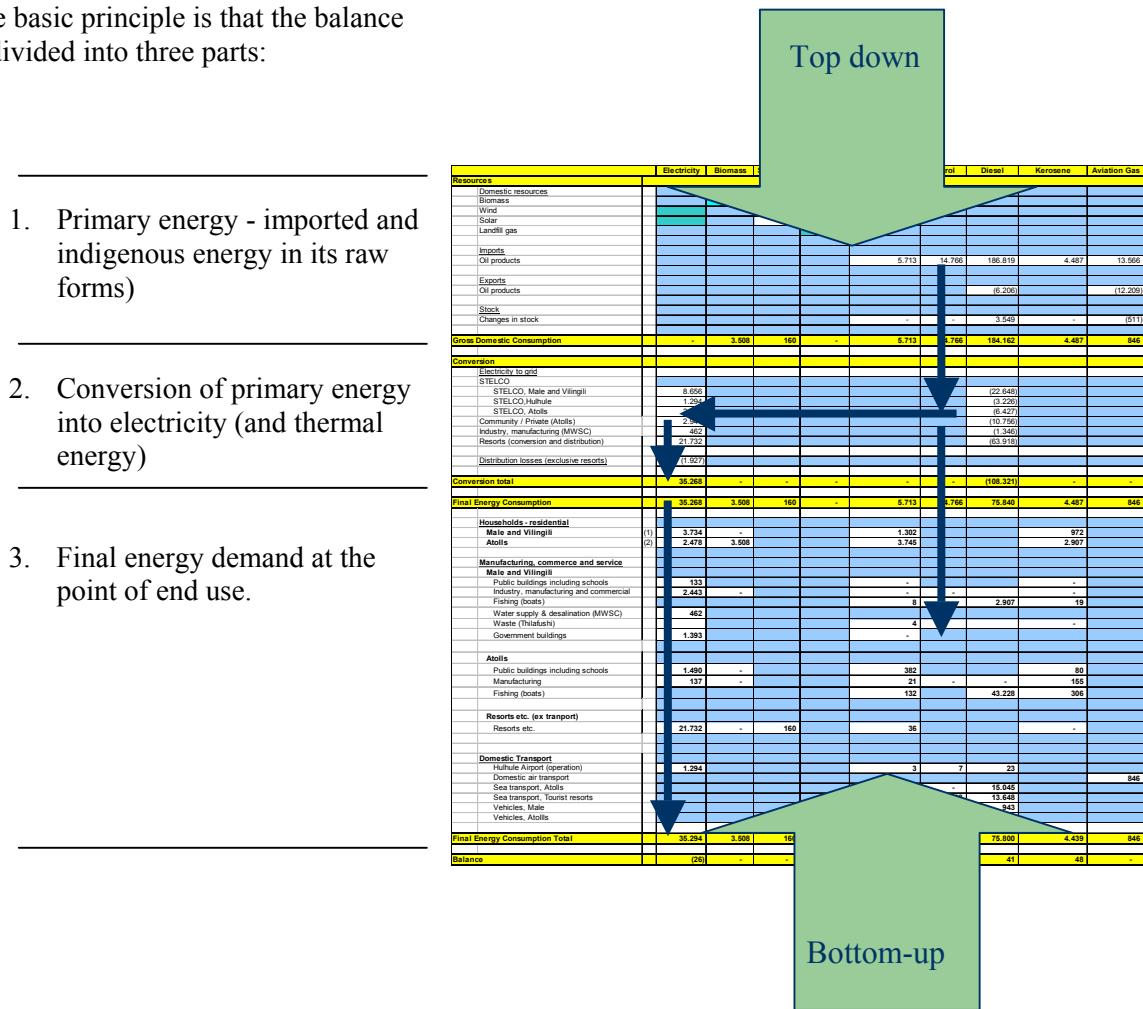

This present very first attempt to establish an energy balance reveals very clearly that this indeed can be done, and that the overview, which an energy balance provides, can be an “eye-opener”, and hopefully give some additional perspective to the on-going energy political debate.

### 3 ENERGY BALANCE METHODOLOGY

#### 3.1 Principle of balance

An energy balance can assume many forms and shapes, but the most commonly used format and methodology refers to the model set-up, which is used by e.g. IEA and OECD.

The basic principle is that the balance is divided into three parts:

It is, in principle, possible to follow the energy flow through the balance, from import/inland resource over conversion to distribution among types of end-users (illustrated by arrows on the figure).

The calculation and development of the figures is an interlinked exercise, as the balance is 0 at the bottom. It is only possible to spend the energy that has entered the system. The interlink is both on the vertical and horizontal level. This means that changes in place has effects in other places – if you spend more one place you have to spend less in other places.

To make sure that there is consistency in the figures, most analyses and data are checked with both top-down (if official data exist) and cross checked with bottom-up analyses.

### **3.2 Unit of energy – tons oil equivalent (toe)**

It is impossible to “add apples and pears”, so therefore we re-calculate into one common unit of measure, which is “ton oil equivalent”, or toe. One toe is the same energy unit as a ton of standard crude oil, and is defined as 11,630 kWh.

All energy forms in the balance is re-calculated into this format. This ensures:

- National comparability between energy carriers, fuels, and energy types
- International comparison and benchmarking

The basic characteristics and toe conversion factors are shown in the table below.

| Energy carrier        | Density<br>(ton/m <sup>3</sup> ) | Heat value<br>(GJ/ton) | Toe conversion factors<br>(toe/ton) |
|-----------------------|----------------------------------|------------------------|-------------------------------------|
| Diesel oil / gas oil  | 0.84                             | 42.7                   | 1.035                               |
| Petrol/motor gasoline | 0.75                             | 43.8                   | 1.070                               |
| Jet petrol (JP 1)     | 0.80                             | 43.5                   | 1.070                               |
| Aviation gasoline     | 0.71                             | 43.8                   | 1.070                               |
| Kerosene              | 0.80                             | 43.5                   | 1.045                               |
| LPG                   | 0.54                             | 46.0                   | 1.130                               |

## 4 DATA AVAILABILITY AND SOURCES

### 4.1 Customs Services

The Maldives Customs Service (MCS) has accurate and comprehensive data on imports of fossil fuels (oil, LPG, kerosene, petrol, aviation gas and aviation jet kerosene, etc.).

The data has been available in electronic form (excel spreadsheet) on an annual basis, but can be broken down into monthly data.

### 4.2 State Trade Organisation

The State Trade Organisation (STO) has information on bunkering and stock levels of oil, LPG and other oil products.

### 4.3 STELCO

The State Electricity Company (STELCO) has over the years developed quite elaborate and informative statistics covering the islands that they supply with power.

### 4.4 Ministry of Transport and Civil Aviation

The Ministry of Transportation and Civil Aviation (MTCA) has been most helpful with the available information regarding the transport sector. Full-scale transport studies have not yet been conducted, and a master plan for the transport sector is under development. Therefore, the actual level of available details has been scarce.

### 4.5 ADB-study

The ADB-report on electricity supply, distribution and demand has provided important insights. A lot of changes in the electricity demand have taken place since 1999 and it seems, therefore, necessary to update the information, as the electricity demand and supply situation seems to be changing rapidly.

### 4.6 Survey questionnaire

In order to acquire a first hand impression of the energy demand pattern, in particular relating to the non-electrical demand in the islands it has been necessary to establish an energy survey.

In September 2003 a comprehensive questionnaire was designed in co-operation with the Ministry of Communication, Science and Technology (MCST). This was sent out to all inhabited islands in the Maldives, asking about end-use of energy, and available biomass resources. In total 72 islands out of 204 inhabited islands have reported back on the questionnaire. The material, which has been received back from the islands represents approximately 82,000 inhabitants out of a total of 201,000 inhabitants in the Islands (not including Male and resorts), or 41%.

An additional survey questionnaire was sent out to 10 selected resort islands (out of a total of 90-100 resort islands).

Male has not been included in the questionnaire, as this area is covered by the official statistics and other previously developed survey and reports.

#### **4.7 Conclusion**

There are some good and solid sources of information, which are able to provide reliable data. In order to accommodate the collection of the necessary information required to establish an annual energy balance some initiatives are necessary. This include:

- Establish regular collection/reporting routines of standardised information from all islands
- Establish regular collection/reporting routines of standardised information from all resorts
- Establish regular reporting of statistics from MCS, STO, MTCA, etc.
- Establish a permanent working group in the MCST to review, analyse and adapt information and prepare energy balance.

## 5 ENERGY BALANCE

### 5.1 Resource

In relation to the data on the resources (primary fuel) used in the Maldives, these data has mainly been obtained from official sources (MCS and STO). This suggests a certain solidity and reliability in the national energy balance as the “input” part of the balance to the Maldives thus is relatively well documented.

#### 5.1.1 Diesel

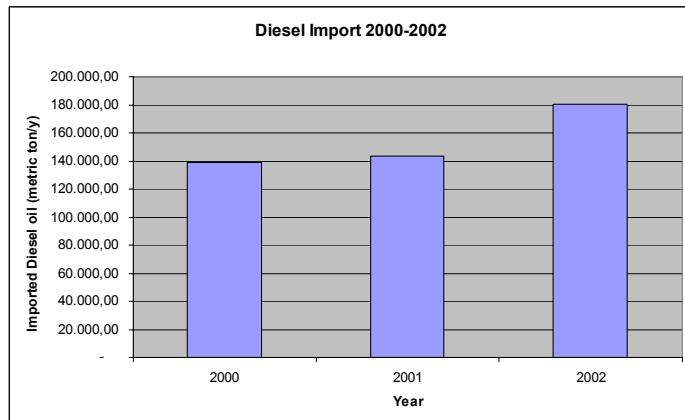

Diesel is the main imported energy carrier. Imports are dominated by State Trade Organisation (STO), which imports 60-70%. Three smaller importers do the rest of the imports.

Maldives Customs Service registers the import, and reliable data can be obtained from their office. The total diesel imported to the Maldives has increased significantly in 2002 compared to the years before.

The import in 2002 is 180,501 metric tonnes, equivalent to 186,819 toe.

In addition to the import the balance consist of net storage of diesel oil, and bunkering.

According to STO the stock level was:

| Fuel stock changes   | 2002   |               | 2003   |               | Change         | Density | Mass t     | Conversion toe/unit | Net stored toe |
|----------------------|--------|---------------|--------|---------------|----------------|---------|------------|---------------------|----------------|
|                      |        | 01-jan-02     |        | 01-jan-03     |                | t/m3    |            |                     |                |
| Diesel               | liters | 14.065.421,00 | liters | 10.378.284,00 | (3.687.137,00) | 0,84    | (3.097,20) | 1,035               | (3.205,60)     |
| STO                  | liters | 7.018.047,62  | liters | 9.189.119,05  | 2.171.071,43   | 0,84    | 1.823,70   | 1,035               | 1.887,53       |
| Maldives Airport Co. | liters | 359.610,00    | liters | 216.600,00    | (143.010,00)   | 0,84    | (120,13)   | 1,035               | (124,33)       |
| Others ??            | liters | 6.687.763,38  | liters | 972.564,95    | (5.715.198,43) | 0,84    | (4.800,77) | 1,035               | (4.968,79)     |

The bunkering was:

| Bunkring - diesel         | Sold to vessels | Density | Mass t | Conversion toe/unit | Net stored toe |
|---------------------------|-----------------|---------|--------|---------------------|----------------|
|                           |                 |         |        |                     |                |
| STO                       | 9645952         | 0,93    | 8971   | 1,035               | 9285           |
| Number of vessels catered |                 |         |        |                     |                |
| Fuel Supplies Maldives    | 3447720         | 0,93    | 3206   | 1,035               | 3319           |
| Number of vessels catered |                 |         |        |                     | 206            |
| Average bunkring, toe     |                 |         |        | 15,6                | 16,1           |
| Hakata                    | 2000000         | 0,93    | 1860   | 1,035               | 1925           |
| Number of vessels catered |                 |         |        |                     | 206            |
| Average bunkring, toe     |                 |         |        | 9,0                 | 9,3            |
| Villa                     | 1000000         | 0,93    | 930    | 1,035               | 963            |
| Number of vessels catered |                 |         |        |                     | 206            |
| Average bunkring, toe     |                 |         |        | 4,5                 | 4,7            |
| <b>Total</b>              | <b>5996</b>     |         |        |                     | <b>6206</b>    |

Bunkering of diesel oil constitutes 6,206 toe.

The net use of diesel oil in 2002 can be calculated as the imports adjusted for the changes in stock and bunkering:

|                                   | <i>Diesel oil<br/>toe</i> |
|-----------------------------------|---------------------------|
| <b>Import</b>                     | 186,819                   |
| - Net stored                      | 3,206                     |
| - Bunkered                        | - 6,206                   |
| <b>Gross domestic consumption</b> | <b>183,818</b>            |

### 5.1.2 Petrol

Petrol is the second largest imported energy carrier. The Maldives Customs Service registers the import, and reliable data can be obtained from their office.

The import in 2002 is 13,800 metric tonnes, equivalent to 14,766 toe. In addition to the import the balance consist of net storage of petrol. According to STO, and other petrol importers, the stock level was:

| <i>Stock Level</i>    | <i>Petrol<br/>Litres</i> | <i>Petrol<br/>toe</i> |
|-----------------------|--------------------------|-----------------------|
| <b>1 January 2002</b> | 1,294,530                |                       |
| <b>1 January 2003</b> | 2,173,097                |                       |
| <b>Net stored</b>     | <b>878,557</b>           | <b>705</b>            |

The net use of diesel oil in 2002 can be calculated as the imports adjusted for the changes in stock.

|                                   | <i>Petrol<br/>toe</i> |
|-----------------------------------|-----------------------|
| <b>Import</b>                     | 14,766                |
| - Net stored                      | -705                  |
| <b>Gross domestic consumption</b> | <b>14,701</b>         |

### 5.1.3 LPG

The Maldives Customs Service registers the import, and reliable data can be obtained from their office. LPG is bottled in the Maldives. The import in 2002 is 5,056 metric tonnes, equivalent to 5,713 toe.

In addition to the import the balance consist of net storage of LPG. According to STO, the stock level was:

| <i>Stock Level</i>    | <i>LPG<br/>Litres</i> | <i>LPG<br/>toe</i> |
|-----------------------|-----------------------|--------------------|
| <b>1 January 2002</b> | 1,338,889             |                    |
| <b>1 January 2003</b> | 577,778               |                    |
| <b>Net stored</b>     | <b>- 761,111</b>      | <b>464</b>         |

The net use of LPG in 2002 can be calculated as the imports adjusted for the changes in stock.

|                                   | <i>LPG<br/>toe</i> |
|-----------------------------------|--------------------|
| <b>Import</b>                     | 4,630              |
| - Net stored                      | 464                |
| <b>Gross domestic consumption</b> | <b>5,094</b>       |

### 5.1.4 Kerosene

The Maldives Customs Service registers the import of “kerosene” and “lamp oil”, and reliable data can be obtained from their office. Lamp oil is included in the kerosene figure as the two products are quite similar. Lamp oil import is 177,739 litres in 2003, and the import of kerosene is 4,152 metric tonnes. Adding the two together, the equivalent energy content is 4,487 toe.

In addition to the import the balance consist of net storage of kerosene. According to STO, and other kerosene importers, the stock level was:

| <i>Stock Level</i>    | <i>Kerosene<br/>Litres</i> | <i>Kerosene<br/>toe</i> |
|-----------------------|----------------------------|-------------------------|
| <b>1 January 2002</b> | 501,788                    |                         |
| <b>1 January 2003</b> | 761,188                    |                         |
| <b>Net stored</b>     | <b>-259,400</b>            | <b>-217</b>             |

The net use of kerosene in 2002 can be calculated as the imports adjusted for the changes in stock.

|                                   | <i>Kerosene<br/>toe</i> |
|-----------------------------------|-------------------------|
| <b>Import</b>                     | 4,487                   |
| - Net stored                      | - 217                   |
| <b>Gross domestic consumption</b> | <b>4,270</b>            |

### 5.1.5 Jet A1

The Maldives Customs Service registers the import of Jet A1 as “aviation gas” and “kerosene”, and reliable data can be obtained from their office. Additional data on stock levels is obtained from Maldives Airport Company.

The import cleared through customs for domestic flights in 2002 is 12,678 metric tonnes, equivalent to 13,566 toe. In addition to the import the balance consist of net storage of aviation gas. According to STO, and other kerosene importers, the stock level was:

| <i>Stock Level</i>    | <i>Aviation gas<br/>m3</i> | <i>Aviation gas<br/>toe</i> |
|-----------------------|----------------------------|-----------------------------|
| <b>1 January 2002</b> | 6,915                      |                             |
| <b>1 January 2003</b> | 8,784                      |                             |
| <b>Net stored</b>     | <b>1,870</b>               | <b>1,601</b>                |

The net use of aviation gas in 2002 can be calculated as the imports adjusted for the changes in stock.

|                                   | <i>Aviation<br/>toe</i> |
|-----------------------------------|-------------------------|
| <b>Import</b>                     | 13,566                  |
| - Net stored                      | 1,601                   |
| <b>Gross domestic consumption</b> | <b>11,965</b>           |

### 5.1.6 Biomass

In September 2003 a comprehensive questionnaire was sent out to all inhabited islands in the Maldives, asking about use of energy, and available biomass resources. Additionally, the Consultant made a series of site visits to 7 small communities on seven different islands in October 2003.

Please also refer to “Technical Report - Biomass Survey”, Assessment of Least-cost, Sustainable Energy Resources, Maldives (Project INT/03/R11 – 02 MDV 1180) for more details on the biomass potential and utilisation.

| Potential for use                        | <i>Potential<br/>toe/year</i> | <i>Used<br/>toe/year</i> | <i>Potential for use<br/>toe/year</i> |
|--|-------------------------------|--------------------------|---------------------------------------|
| <b><u>Inhabited Islands</u></b>          |                               |                          |                                       |
| Solid agro waste                         | 7,964                         | 4,626                    | 3,337                                 |
| Animal waste                             | -                             | -                        | -                                     |
| Household waste                          | 588                           | -                        | 588                                   |
| Landfill gas                             | -                             | -                        | -                                     |
| <b><u>Male Villingili</u></b>            |                               |                          |                                       |
| Solid agro waste                         | 517                           | -                        | 517                                   |

| Landfill gas                             | 900                           | -                        | 900                                   |
| <b><u>Un-inhabited islands</u></b>       |                               |                          |                                       |
| Solid agro waste                         | 5,556                         | -                        | 5,556                                 |
| Organic waste                            | -                             | -                        | -                                     |
| <b>Total without uninhabited islands</b> | <b>~ 19,500</b>               | <b>4,626</b>             | <b>~ 14,900</b>                       |

The use of biomass on the Maldives differs very much from island to island, but generally fuel wood is the main consumer of biomass for energy; fuel for cooking and for smoking of fish.

In many cases the coconut fibres have been reported used for rope, some traditional houses with roof and walls made from palm leaves are still seen in some remote communities.

### 5.1.7 Solar heat

In relation to the present use of solar heating, this technology it is primarily used in resorts for heating of water. Based on the questionnaire survey sent out to selected resorts a qualified estimation is made, based on the following assumptions.

## Assumptions

|   |                        |
|---|------------------------|
| Number of resorts                               | 87                     |
| Bed capacity                                    | 16,400                 |
| of which with solar hot water                   | 50%                    |
| of which with solar hot water                   | 8,200                  |
| Bed Capacity Utilization Rate (%) (2002)        | 68.9%                  |
| Total number of bednights                       | 4,066,000              |
|   |                        |
| Number of solar m <sup>2</sup> per bed          | 0.5                    |
| Number of m <sup>2</sup> solar collector in use | 2,825                  |
| Average daily heat produced by solar, per bed   | 0.9 kWh                |
| Average yearly production by solar, per bed     | 329 kWh                |
| <b>Solar heat utilised /year</b>                | <b>1,856 MWh</b>       |
| <b>Solar heat utilised /year</b>                | <b>160 toe</b>         |
|   |                        |
| Volume of water heated                          | 22 C, /day/ bed        |
| Estimated demand for hot water per bed night    | 35.1 Liter             |
|   |                        |
| Volume of water heated per year                 | 72,310 m <sup>3</sup>  |
| Yearly demand for hot water                     | 243,960 m <sup>3</sup> |
| <b>Covered by solar heating</b>                 | <b>30%</b>             |

The use of solar heating in 2002 expresses the net utilised energy on the user side, i.e. in the showers.

|                            | <i>Solar heat<br/>toe</i> |
|----------------------------|---------------------------|
| Gross domestic consumption | 160                       |

## **5.1.8 Electricity**

On the resource side the only electricity aspect could be wind or PV based production of electricity, which at the moment is not performed on any scale of significance.

The only primary production of electricity is conducted by the telecommunication company Dhiraagu, which have some PV panels in use to supply their masts with power for stand-alone operation in remote locations.

### **5.1.9 Landfill gas**

Landfill gas is not extracted. The first demonstration has been established at the landfill location serving Male and Villingili.

## 5.2 Conversion

The by far most significant energy conversion is the process of converting oil products to electricity. In future, there might also be potential for conversion between landfill gas and electricity.

Some of the conversion factors, especially those related to STELCO (diesel to electricity in STELCO operated areas), are well documented. However, the part covering the islands outside STELCO, and the resorts are more difficult to assess. These areas are covered by the surveys, and the results from these surveys, have been extrapolated to national scale.

### 5.2.1 Diesel to electricity

All the electricity production is based on diesel generators. The electricity production is decentralised, and based on production units of various size.

#### **STELCO supplied area**

The State owned electricity company STELCO provides a little more than 1/3 of the electricity produced in the Maldives. STELCO serves Male/Vilingili/Hulhule plus additional networks on other 21 locations in the Islands (22-24 islands). STELCO has good quality data material providing details on each of their networks regarding production of electricity, and consumption of diesel.

#### Production

Electricity production data is provided in the data annex. From the annex it seems evident that the production is almost constant over the year (from month to month). Production for Male/Vilingili/Hulhule islands represents approximately 82% of the total STELCO production of 140,849 MWh in 2002.

The use of diesel oil for electricity production is available from official statistics (see also data annex). Combining this information with the production data, and the electricity utilisation data, it is possible to analyse and calculate the conversion efficiency for all STELCO served area, and the distribution loss for Male specifically. The conversion efficiency varies between 25-40%, depending on the size, and operation of the installation.

#### Distribution

|  |                     |
|--|---------------------|
| Distribution loss Male:                  | 11%                 |
| Distribution loss on Vilingili:          | Same as Male (11%)  |
| Distribution loss on Hulhule:            | Less than Male (5%) |
| Distribution loss remaining STELCO area: | 13%                 |

The distribution loss assumed to be 13% in the islands served by STELCO is estimated on basis of data from 8 sample islands and Male analysed in the “Preparing for Outer Island Electricification Project”, 2000 ADB.

#### **Private/Community supplied area**

The remaining inhabited islands are served by private and/or community owned electricity producers.

Data material from these islands is difficult to obtain, and the consumption has been analysed and estimated based on the following methodology:

- Sample island analysis => electricity sales => specific electricity sales (kWh/capita) => extrapolation to all atoll islands (outside STELCO) => re-calculation via distribution and loss => electricity production => re-calculation via conversion loss => diesel oil requirement

### Sample island analysis

| Sample islands<br>(outside Stelco<br>area) | Electricity sales<br>1999<br>(from ADB study)<br>(kWh/year) | Electricity sales<br>2002<br>(from UNDP study)<br>(kWh/year) |
|--|---|--|
| Nolhivaramu                                | 53,172  | 54,540   |
| Neykurendhoo                               | 24,336  | 53,698   |
| Vaikaradhoo                                | 119,652   | 217,518  |
| Funadhoo                                   | 70,836  | 234,591  |
| Mulah                                      | 157,416   | 286,170  |
| Muli                                       | 219,564   | 326,000  |
| <b>Total</b>                               | <b>646,975</b>  | <b>1,172,518</b>   |

The amount of inhabitants on the 6 islands in 2002 was 6,685, which provides an average specific electricity demand per capita of 175 kWh/cap/year

### Distribution

On the basis of the analysis in the “Preparing for Outer Island Electricification Project”, 2000 ADB, we have assumed the distribution loss to be 24%.

### Production

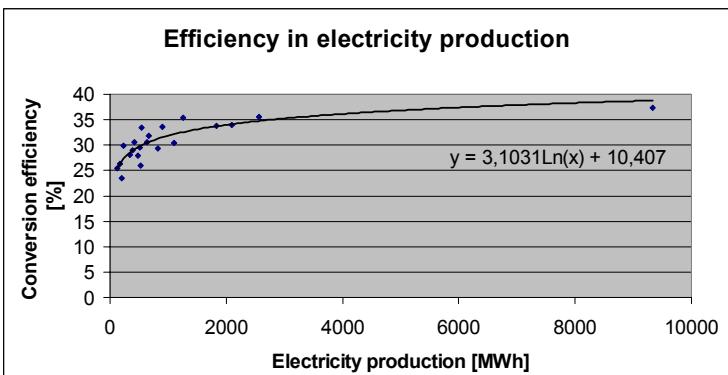

By extrapolating the specific electricity demand to all non-Stelco supplied islands using the amount of inhabitants, and compensating for the distribution loss, the total electricity production can be calculated.

As the conversion efficiency of the diesel gen-set varies with the size of the production installation and the general maintenance level, this has been analysed and incorporated into the survey.

Based on the known conversion efficiency of a number of production units in the Maldives it has been

possible to establish a satisfactory relation between the expected production efficiency based on the total production of an installation. The assumption that the efficiency is relative to the total electricity production is reasonable from the following point of view:

- An increasing production requires a larger production unit which increase efficiency
- An increasing production requires that the existing unit run for more hours which increase efficiency

The conversion efficiency (y) has been modelled based on the analysis to be  $y = 3.1031\ln(x) + 10,407$ , where (x) is the electricity production, and the minimum efficiency is set at 25%.

This methodology provides a reasonable result, which can compensate for the difference in size of installations.

The table below indicate the methodology used.

| <i>Atoll islands<br/>(outside Stelco<br/>supply area)</i> | <i>Population<br/>2002</i> | <i>Specific<br/>electricity<br/>utilisation</i> | <i>Total electricity<br/>utilisation</i> | <i>Electricity<br/>distribution<br/>loss</i> | <i>Total<br/>electricity<br/>production</i> | <i>Fuel<br/>conversion<br/>efficiency</i> | <i>Oil input</i> | <i>Oil input</i> |

| <b>Utheemu</b>  | 600                        | 175   | 105,314                                  | 24%  | 138,571                                     | 26%                                       | 538,985          | 46               |
| etc...  |                            |   |  |  |   |   |                  |                  |
| etc..   |                            |   |  |  |   |   |                  |                  |
| <b>Total (for all islands)</b>                            |                            |   |  |  | <b>34,238,536</b>                           |   | <b>10,756</b>    |                  |

The main result for the islands supplied from community/privately owned production units can be summarised as:

| <i>Oil / Electricity</i>      | <i>Total<br/>toe</i> |
|-------------------------------|----------------------|
| <b>Total oil consumption</b>  | <b>10,756</b>        |
| <b>Electricity production</b> | <b>2,944</b>         |

### Resorts

All tourist resort islands have their own private electricity production. Detailed data covering all of these islands has not been available. A data questionnaire has been issued to produce a reliable basis for analysis of the resort consumption. There were in total 87 resorts registered in 2002 in the Maldives.

### Production

Based on an analysis of the replies, it can be established that the average use of diesel for electricity production is 3,807.5 kg/bed.

Using “bed” as the unit of scaling instead of “bednight” is based on the fact that by far the main part of the electricity demand is constant, as the A/C system and water pumps are in operation in all rooms/guest facilities regardless if there is guests or not.

| <i>Oil / Electricity</i>               | <i>Unit</i>   | <i>Comments</i>                  | <i>Total</i>      |
|--|---------------|----------------------------------|-------------------|
| <b>Oil consumption for electricity</b> | <b>kg/bed</b> |                                  | <b>3,807.5</b>    |
| <b>Total beds</b>                      | <b>beds</b>   | In 2002                          | <b>16,400</b>     |
| <b>Total oil consumption</b>           | <b>toe</b>    |                                  | <b>63,918 toe</b> |
| <b>Electricity production</b>          | <b>toe</b>    | <b>Conversion efficiency 34%</b> | <b>21,732 toe</b> |

The average conversion efficiency of 34% is based on information from selected resorts, and site visit experience with the level of maintenance and operation of the diesel gensets.

### Distribution

Because of the special nature of the end-use, the distribution loss is perceived as included in the end-use.

### Industrial

The desalination company (Maldives Sewage and Water Company) serving in Male and Vilingili have their own electricity production, which is utilised for desalination. All data from this production has been made available.

|  | <i>Male</i>      | <i>Vilingili</i> | <i>Total</i>     |
|--|------------------|------------------|------------------|
| <b>Yearly diesel consumption</b>                 | <b>1,255 toe</b> | <b>90 toe</b>    | <b>1,346 toe</b> |
| <b>Yearly electricity production and end-use</b> |                  |                  | <b>462 toe</b>   |

Source: MWSC

Additionally, there is some industrial activity in connection to freezing/cooling storage facilities for fish. There is in total three installations, and one, which additionally produces, canned fish. The demand for diesel oil for electricity and steam production at the three industrial plants is provided by MifCo.

|   |                 | <i>Fish<br/>canning</i> | <i>Freezing<br/>plant</i> | <i>Freezing<br/>plant</i> | <i>Total</i> |

### **5.2.2 Other**

No other forms of conversion of energy have been identified.

## 5.3 Demand

In the following the energy demand is analysed and described.

### 5.3.1 Household, Manufacturing and Public sector

The break down on households for Male and Vilingili can be established from combining the information regarding electricity production, distribution losses (from STELCO), and population with information from the 2000 census on electrical appliances and utilisation in the household sector.

The break down on public and manufacturing for Male and Vilingili can be established from combining the information regarding electricity production, distribution losses (from STELCO), and population with information from the official 2002 statistics on electrical utilisation.

Looking at electricity alone there are significant differences in the consumption pattern between Male and Islands (approximately a factor 5). The difference between the Stelco supplied areas and the private/community-supplied areas is ascribed to the more developed and stable supply in Stelco's areas. A stable supply provides for larger consumption.

| Area                                       | Specific electricity demand<br>kWh/capita/year |
|--|--|
| Male & Villingili                          | 1,131  |
| Islands (average)                          | 234  |
| - Stelco production areas                  | 333  |
| - Private/community owned production areas | 175  |

The specific energy demand per capita (kWh/capita) is seen below for Male & Vilingili and for Islands, the total energy demand per capita being close to 90% higher in Male & Vilingili than in the Islands or 60% higher when not including the consumption of the Government Buildings.

If looking solely at the consumption in households the consumption per capita is 33% higher for Male & Vilingili than for Atolls.

| Male&Vilingili                    | Population: 79191 |            |              |              |
|-----------------------------------|-------------------|------------|--------------|--------------|

|                                   | 204,5             | 0          | 0            | 0            |
| <b>Total</b>                      | <b>1131,2</b>     | <b>0,0</b> | <b>136,7</b> | <b>129,5</b> |

The breakdown regarding electricity, biomass, LPG and kerosene on households, public and manufacturing & commerce for the Islands is based on a demand survey, which was issued during September-October 2003, and sent to all inhabited islands. From the response it has been possible to establish a realistic distribution of the energy consumption between the different types of end-use.

| Atolls                            |  | Population: 201559 |         |       |          |
|-----------------------------------|--|--------------------|---------|-------|----------|
| kWh/capita                        |  | Electricity        | Biomass | LPG   | Kerosene |
| <b>Households</b>                 |  | 139,8              | 168,8   | 205,2 | 162,6    |
| Lightning                         |  | 64,6               |         |       | 13,6     |

| Cooking and smoking               |  | 9,6                | 168,8   | 205,2 | 149,0    |
| Others                            |  | 2,3                |         | 0     |          |
| <b>Public</b>                     |  | 86,0               | 0,0     | 22,0  | 4,6      |
| Lightning                         |  | 52,2               |         |       | 0        |
| Appliances & AC                   |  | 33,7               |         |       | 3,6      |
| Cooking and smoking               |  | 0,0                | 0,0     | 22    | 1,1      |
| Others                            |  | 0,0                |         | 0     | 0        |
| <b>Manufacturing&amp;commerce</b> |  | 7,9                | 0,0     | 1,2   | 8,9      |
| Lightning                         |  | 4,0                |         |       | 5,4      |
| Appliances & AC                   |  | 3,9                |         |       | 3,6      |
| Cooking and smoking               |  | 0,0                |         | 1,2   | 0        |
| Others                            |  | 0,0                |         | 0     | 0        |
| <b>Total</b>                      |  | 233,7              | 168,8   | 228,4 | 176,1    |

However, some additional investigations and analysis regarding the use of energy for cooking and smoking has been made to supplement the available material.

### Cooking

From the ‘Population and housing Census, 2000’ a lot of useful information has been found. Never the less it has been encountered that some changes in the consumption fuels have taken place since 2000. Wood is used much less for cooking than in 2000 and the use of wood in Male has totally vanished.

The analysis is based on MPND, Population and Housing Census 2000, table H-17: “Households classified by type of living quarters and fuel used for cooking” containing data for the year 2000.

The use of type of fuel for cooking is undergoing changes. The main structural change is a reduction in use of fuel wood and biomass and an increase in use of LPG and electricity see also (Shaheed 2001 RETDAP).

The distribution of fuels has been changed to reflect the expected situation in 2002. As a guide to the magnitude of change, the result of the Biomass Survey, including the survey questionnaire as well as the imports figures of LPG has been used.

### Assumptions:

The assumptions made include:

- Utilised energy for cooking (supplied to the pan/pot/oven) is 3.50<sup>1</sup> kWh/day/household
- Efficiency in utilisation of fuels

<sup>1</sup> This is equivalent of 2 average cooking places (each 575 W) used for approx. 3 hours/day.

| Fuel                                   | Efficiency <sup>2</sup> |
|--|-------------------------|
| Firewood                               | 20%                     |
| Kerosene oil                           | 50%                     |
| LPG                                    | 50%                     |
| Electricity                            | 95%                     |
| Other (not defined – probably biomass) | 20%                     |

#### Changes in use of fuel type

Based on the biomass survey the consumption for 72 out of 202 inhabited islands (representing 82,046 out of the total Atoll population of 201,559) can be established. It is assumed that Male and neighbouring islands does not use fuel wood/biomass.

To establish the consumption for all Maldives an extrapolation has been made. Thus the total consumption of biomass for cooking and smoking is 34,000 MWh/year.

Based on this level of biomass use, and the assumed specific energy use for cooking (3.5 kWh/cap/day) it can be deducted that 13,500 households (out of total 18,887 households) has stopped using biomass for cooking, and is instead using kerosene oil, LPG or electricity.

Moreover, investigations have shown several islands have converted almost totally to electricity for cooking purposes during a very short period (12-24 months). Based on this it is assumed that in total 1,400 households has converted to electricity.

#### **5.3.2 Water supply and desalination**

The energy consumption related to water supply and desalination includes the public installations providing water and desalination for Male and Vilingli, serviced by Male Water and Sewage Company (MWSC).

The electricity for the system is produced at diesel gen-sets at the MWSC premises.

|   | Unit       | Male   | Vilingli | Total  |
|---|------------|--------|----------|--------|
| Water production per day                  | m3         | 4,000  | 120      | 4,120  |
| Specific Energy Consumption               | kWh/m3     | 3.5    | 6.0      |        |
| Daily Consumption                         | kWh        | 14,000 | 720      | 14,720 |
| Yearly electricity consumption            | MWh        | 5,110  | 263      | 5,373  |
| Efficiency in electricity production      |            | 0.35   | 0.25     |        |
| Diesel consumption                        | Litre/year | 14,600 | 1,051    | 15,651 |
| Yearly diesel consumption                 | toe        | 1,255  | 90       | 1,346  |
| Yearly electricity production and end-use | toe        |        |          | 462    |

Source: MWSC

There are also some desalination installations on the resorts, but these have been included in the end-use analysis for resorts.

<sup>2</sup> ESMAP, Guinea, Household Energy Strategy, Report no 163/94, World Bank 1994

### 5.3.3 Resorts

As the consumption of energy is significant in the tourist resorts, a specific investigation is prepared for this area. There were in total 87 resorts registered in 2002 in the Maldives.

There is no official information available on the energy consumption in the resorts, and therefore a survey covering a selection of 10 resorts has been conducted during October-December 2003, to establish the level of use of energy resources and consumption pattern.

Based on an analysis of the replies, the following assumptions can be established:

- Use of diesel for electricity production: 3,807.5 kg/bed
- Use of fuel for transportation is dealt with elsewhere.
- Use of LPG for cooking: 0.0078 kg/bed night

Using “bed” as the unit of scaling instead of “bednight” is based on the fact that by far the main part of the electricity demand is constant, as the A/C system and water pumps are in operation in all rooms/guest facilities regardless if there is guests or not.

| <b>Oil / Electricity</b>               | <b>Unit</b> | <b>Comments</b>                  | <b>Total</b>      |
|--|-------------|----------------------------------|-------------------|
| <b>Oil consumption for electricity</b> | kg/bed      |                                  | 3,807.5           |
| <b>Total beds 2002</b>                 | beds        | In 2002                          | 16,400            |
| <b>Total oil consumption</b>           | toe         |                                  | <b>63,918 toe</b> |
| <b>Electricity production</b>          | toe         | <b>Conversion efficiency 34%</b> | <b>21,732 toe</b> |

The use of LPG for cooking is, on the contrary, related to the amount of meals and therefore to the actual tourist bed nights.

| <b>LPG</b>                         | <b>Unit</b>  | <b>Comments</b> | <b>Total</b>  |
|------------------------------------|--------------|-----------------|---------------|
| <b>LPG consumption for cooking</b> | kg/bed-night |                 | 0.0078        |
| <b>Total bed-nights 2002</b>       | bed-night    | In 2002         | 4,066,000     |
| <b>Total LPG consumption</b>       | toe          |                 | <b>36 toe</b> |

### 5.3.4 Fishing

The analysis of the energy consumption for fishing is based on Statistical yearbook, Table 8.8 : “Fish Catch, Fishing Trips and Catch per Unit Effort by Locality, 2001”. This provides the amount of fishing trips per boat type.

The following assumptions are made:

| <b>Engine</b> | <b>Oil consumption</b> | <b>Operation</b> |                   |                 | <b>Total</b>     | <b>Distribution of vessels</b> | <b>Total diesel oil</b> |
|---------------|------------------------|------------------|-------------------|-----------------|------------------|--------------------------------|-------------------------|
|               |                        | <b>hp</b>        | <b>Litre/hour</b> | <b>Hour/day</b> | <b>Days/year</b> |                                |                         |
| 400           | 80                     | 10               | 200               |                 | 160,000          | 55                             | 8,816,000               |
| 240           | 52                     | 10               | 150               |                 | 78,000           | 249                            | 19,426,056              |
| 140           | 27                     | 9                | 150               |                 | 36,450           | 798                            | 29,081,560              |
| 40            | 12                     | 10               | 150               |                 | 18,000           | 59                             | 1,062,000               |
| <b>Total</b>  |                        |                  |                   |                 |                  | <b>1,161</b>                   | <b>58,385,616</b>       |

| <b>Male'</b>  | <b>7,909,657</b>   | <b>6,877</b>  |
| <b>Atolls</b> | <b>50,475,959</b>  | <b>43,884</b> |
| <b>Total</b>  | <b>58,385,616</b>  | <b>50,760</b> |

### 5.3.5 Travel person/freight related to Islands

The analysis of the energy consumption for travel and freight transport to and from Islands, and inside Islands is based on the Statistical yearbook, Table 1.5: "Area and Distance to Male' and Atoll Capitals, by Locality, 2001 – 2002".

The following assumptions are made:

- Travel from island to Male: 1 return trip every 2<sup>nd</sup> week in dhoni
- Travel from Atoll capital to Male: 1,5 return trip per week in small ferry

|                        | <b>Travel<br/>km/year</b> | <b>Boat<br/>type</b> | <b>Engine<br/>hp</b> | <b>Fuel<br/>consumption<br/>liter/km</b> | <b>Total<br/>Liter</b> |
|------------------------|---------------------------|----------------------|----------------------|--|------------------------|
| Travel islands/Male    | 2,038,192                 | Dhoni                | 150                  | 1.7                                      | 3,464,926              |
| Travel Atolls cap/Male | 760,240                   | Smal ferry           | 1,000                | 9.1                                      | 6,892,843              |
| <b>Total</b>           | <b>2,798,432</b>          |                      |                      |  | <b>10,357,769</b>      |
| <b>Total</b>           |                           |                      |                      | <b>toe</b>                               | <b>9,005</b>           |

### Travel person/freight related to/from Resorts

The analysis of the energy consumption for travel and freight transport to and from tourist reaorts, based on the Statistical yearbook, Table 10.3: "Bed Capacity of Tourist Resorts and the Distance from the Airport, 1999 – 2002"

The following assumptions are made:

- If the distance between Male/airport and resort is more than 80 km, the passenger transport is primarily airborne and is accounted for elsewhere in the energy balance. However, a high speed ferry trip is included (average 1 trip per week) for the distant resorts.
- The analysis distinguishes between two type of boat travel: collection of passengers, and regular trips. The regular trips include small freight jobs, staff transport, etc.
- It is furthermore assumed that all collection and transfer of passenger is made in speedboats (type Gulfcraft engine 2x200 HP), and that all regular trips is made in lauches (or dhoni type of vessel).

- If the distance between Male/airport is less than 80 km, the passenger collection and regular trips are carried out according to the following assumptions regarding the amount of trips per day:

|                                     | <i>Far from Male &gt; 25 km<br/>Trips per day</i> | <i>Close to Male &lt; 25 km<br/>Trips per day</i> |
|-------------------------------------|---|---|
| <b><u>Collecting passengers</u></b> |   |   |
| <b>Large resort &gt; 150 beds</b>   | 3   | 3   |
| <b>Small resort &lt; 150 beds</b>   | 2   | 2   |
| <b><u>Regular trips</u></b>         |   |   |
| <b>Large resort</b>                 | 1   | 3   |
| <b>Small resort</b>                 | 0 ( <i>note 1</i> )                               | 3   |

Note 1: it is assumed that a small resort far from Male would include all the necessary freight, staff transport etc. in the trips made to collect/deliver passengers/tourists.

| Vessel type                           | Engine              | Speed<br>km/h | Fuel<br>l/km | Fuel   | Total      | toe          |
|---------------------------------------|---------------------|---------------|--------------|--------|------------|--------------|
| <b>Launch</b>                         | 145 hp inboard      | 16            | 1.7          | Diesel | 9,641,577  | <b>8,382</b> |
| <b>Speedboat Gulfcraft</b>            | 2 x 200 hp outboard | 65            | 8.5          | Petrol | 10,686,872 | <b>8,576</b> |
| <b>High speed ferry (100-150pers)</b> | 4000 hp in board    | 65            | 40.0         | Diesel | 241,760    | <b>217</b>   |

### Vehicles

The analysis of the energy consumption for land transport in vehicles is based on the Statistical yearbook, Table 11.3: "Registered and Newly Registered Vehicles According to Type, 2000 – 2002", and information directly from the Ministry of Transport.

In the table below the assumptions made regarding the distribution between petrol and diesel fuel is made (based on input from Ministry of Transport), and the average distance and fuel economy.

| Type of vehicles               | Petrol | Diesel | Avg.<br>Distance<br>(km/day) | Mileage<br>(km/year) | Fuel<br>economy<br>petrol<br>(km/l) | Fuel<br>economy<br>diesel<br>(km/l) |
|--------------------------------|--------|--------|------------------------------|----------------------|-------------------------------------|-------------------------------------|
| <b>Motor Car</b>               | 100%   | 0%     | 15.00                        | 5,475                | 12.0                                | 14.0                                |

In total the un-accounted part of the energy balance is less than 0.08%, or 0.0008, which is satisfactory.

### **Primary Energy Consumption**

Imported fossil fuels, primarily diesel, totally dominate primary energy consumption, as it constitutes 83% of the total primary energy demand.

Indigenous renewable energy constitutes only approximately 2% of the primary energy use.

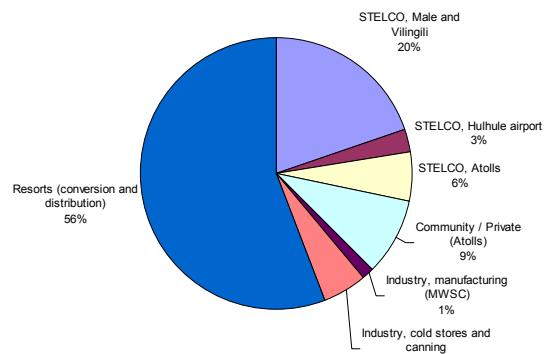

### **Conversion**

Almost 56% of the diesel oil used for electricity production is used in the resorts, 29% is used for electricity production by STELCO, and the remaining 15% is used in the islands and for industrial purposes.

There is definitely room for improvement in the overall system efficiency.

The conversion and distribution losses of the electricity sector are high, especially in islands where the electricity production and distribution is organised by privately/community owned operators.

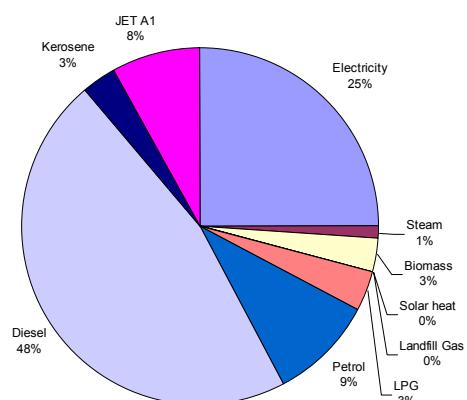

### **Final Energy Demand**

The final energy consumption includes only 3% biomass.

The dominant final use of energy is diesel primarily for fishing and sea-based transport to and from inhabited islands and resorts.

The final electricity demand is primarily used at the resorts (~ 59%).

### **Emission**

The total green house gas emission from the energy supply in the Maldives is concentrated on the emission from the imported fossil fuels, which constitutes approximately 665,000 ton CO<sub>2</sub> per year.

## 7 CONCLUSION AND RECOMMENDATIONS

This report provides the very first comprehensive energy balance for the Maldives. Earlier attempts have been made in the mid 1980's, but the work from this period was never followed through.

### 7.1 Sources of information

There are good and solid sources of information, which are able to provide reliable data, available in the Maldives. This includes:

- The Maldives Customs Service (MCS) has accurate and comprehensive data on imports of fossil fuels (oil, LPG, kerosene, petrol, aviation gas and aviation jet kerosene, etc.).
- The State Trade Organisation (STO) has information on bunkering and stock levels of oil, LPG and other oil products.
- The State Electricity Company (STELCO) has over the years developed quite elaborate and informative statistics covering the islands that they supply with power.
- The Ministry of Transportation and Civil Aviation (MTCA) has been most helpful with the available information regarding the transport sector.
- Official statistics from the "2000 Census", and the annual statistical yearbooks.
- The ADB-report on electricity supply, distribution and demand has provided important in-sights.
- Survey questionnaire has been used to supplement the available sources

### 7.2 Purpose of Energy Balance

A reliable energy balance is the fundamental requirement for establishing reliable modelling of the potential energy market development, and the effects of any given market intervention.

So, in essence an energy balance is necessary to provide an understanding of the complexity of the energy sector and to assess the social, legal, technological, financial and economic effects of any measure of intervention into the energy sector.

### 7.3 Primary Energy Consumption

Imported fossil fuels, primarily diesel, totally dominate primary energy consumption, as it constitutes 83% of the total primary energy demand. Indigenous renewable energy constitutes only approximately 2% of the primary energy use.

### 7.4 Conversion

Almost 56% of the diesel oil used for electricity production is used in the resorts, 29% is used for electricity production by STELCO, and the remaining 15% is used in the islands and for industrial purposes.

## 7.5 Final Energy Demand

The final energy consumption includes only 3% biomass. The dominant final use of energy is diesel primarily for fishing and sea-based transport to and from inhabited islands and resorts. The final electricity demand is primarily used at the resorts (~ 59%).

## 7.6 Emission

The total green house gas emission from the energy supply in the Maldives is concentrated on the emission from the imported fossil fuels, which constitutes approximately 665,000 ton CO<sub>2</sub> per year.

## 7.7 Recommendations for future energy balances

In order to accommodate a systematic collection of the necessary information required establishing an annual energy balance some additional initiatives are necessary. This could include:

- Establish regular collection/reporting routines of standardised energy information from all islands
- Establish regular collection/reporting routines of standardised energy information from all resorts
- Establish regular reporting routines of official statistics from MCS, STO, MTCA, etc.
- Establish a permanent working group in the MCST to review, analyse and adapt information and prepare energy balance.

## 8 Data Annex

This annex contains all the database and spreadsheet analyses, which has been established in order to provide input for the energy balance.

Use: Diesel is used as fuel for automobiles and marine outboard engines in the transportation sector, and it is also consumed by ocean-going ships calling at Male'. Finally, diesel is used in industries (e.g., sea water desalination in Male' and the cement and LPG bottling industry in Thilafushi island near Male').

**Aviation Gas**
